

Suggested Technique For TB Skin Testing Using 1cc VanishPoint® Tuberculin Syringe

1. Prepare injection
2. Give intradermal injection using aseptic technique according to institutional policy.
3. Using other hand, fully depress plunger to administer full dose and activate automatic needle retraction *while needle is still in patient*. Needle will automatically retract into syringe, preventing exposure to contaminated needle and rendering syringe non-reusable. Dispose in appropriate sharps container per protocol of institution.
